EOIP Documentation and Product Status

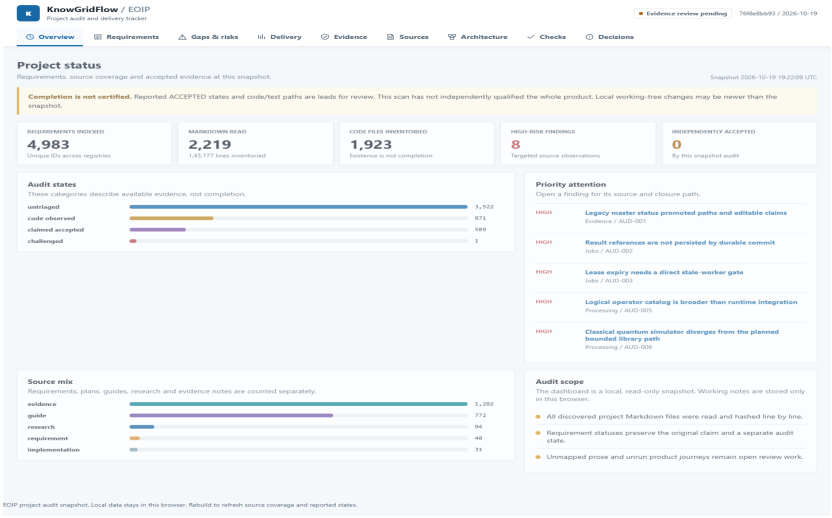

KnowGridFlow / EOIP | 20 October 2026

This manual explains the primary web application and its documented local profiles. Authenticated behavior depends on a configured deployment and authorized role. Screenshots show observed local states, not full-product acceptance.

Dashboards and project status

Use the application dashboards and the separate offline audit tracker without confusing their purposes.

Availability: Conditional app dashboards; offline audit snapshot available

Offline project audit dashboard

EOIP-master-dashboard.html at the repository root is a separate project-delivery tracker, not the application analytics portal. Open it directly in a browser. Tabs cover overview, requirements, gaps, delivery, evidence, sources, architecture, checks and decisions. The file contains a point-in-time snapshot; rebuild with python scripts/build_unified_audit.py after source changes.

1. Open the root dashboard HTML without a server.
2. Search a requirement ID and inspect both its reported state and audit state.
3. Use Gaps and Evidence to see closure actions and evidence limits.
4. Export filtered CSV or local decision notes; these exports do not change acceptance.

Interpret status honestly

The current structural audit indexed thousands of requirement IDs but independently certified none in a full runtime release gate. 'Code observed' means a referenced path exists, not that the user journey works. 'Claimed accepted' preserves a historical ledger statement, not an independently verified production outcome.
